

NotebookLM in Action

What if you could turn any webpage into a polished video summary in under five minutes? By the end of this session, you will have done exactly that.

What NotebookLM Actually Is

A Google AI tool that works only from sources you give it. No open web searches. No hallucinated context. Just your material, synthesized.

You add sources.

You ask questions.

You generate outputs.

Everything stays inside your private notebook workspace.

The Piece We Are Using Today—Studio

Studio is the panel inside every notebook for generating rich content formats.

Audio Overviews

Video Overviews

More

Today we are using Video Overview: a structured, presenter-style summary built from your source. It is genuinely useful for absorbing complex material fast, or sharing it with someone else.

See the NotebookLM Interface First

70 seconds watching it done is worth seven minutes reading about it.

[Watch 70 second video](#)

When you come back, I'll walk you through the building of your first Video Overview on NotebookLM

What We Are Doing Today

One clear outcome.

01

Add a website as a source.

02

Generate a Video Overview.

03

Leave with a written record of how you did it.

Three steps. Sixteen minutes. Let's go.

Step 1—Open NotebookLM

Open a new browser tab right now.

Go here and sign in with your Google account: notebooklm.google.com

Take your time. Let me know when you are signed in and ready.

Step 2 —Create a New Notebook

Click New Notebook.

Give it a name that means something to you — a project, a topic, a client. (top left above the workspace)

This is your private workspace.

Nothing here is shared unless you share it.

Ready when you are.

Step 3 —Add a Website Source

In the Sources panel, click **Add Source** and choose **Website**.

Paste in a URL from any site you find useful or relevant right now. A news article, a company page, an industry report online — anything works.

Paste it in and click **Add**.

Step 4 —Confirm the Source Has Been Processed

Watch the Sources list on the left. When NotebookLM finishes processing, your source appears with a title and a short summary beneath it.

✅ That means it is ready. The AI now has your material to work from.

Good to move on whenever you see it.

Step 5 —Open Studio

Look for the Studio panel, usually on the right side like you saw in the video.

Click it. This is where content generation lives.

Take a moment to look around before we generate anything. Note the possibilities:

- Audio Overviews that sound like podcasts
- Infographics
- Quizzes
- Reports
- Flashcards
- And more

Step 6 —Generate Your Video Overview

01

Inside Studio, select Video Overview.

02

Click Generate.

03

Now wait. This takes a moment. That is normal.

NotebookLM is building a structured presenter-style video directly from the source you added.

Step 7—Review What Was Created

Take a look at the Video Overview. Notice how the structure and content draw directly from the source you added, not from anything else.

📄 This is what grounded AI output looks like. You just built it in under five minutes.

Take Your Steps With You

Before you close out, you can ask me to produce a written summary of everything you just did. A clean, step-by-step document you can keep and reuse.

Just say or type this phrase to me now:

"Create a document about the steps to make a Video Overview"

Where to Take This Next

NotebookLM is most useful when you bring it your own material.

- A PDF report before a big meeting.
- A long article you need to absorb fast.
- A set of notes you want to interrogate.

Try an Audio Overview on your commute. Ask the notebook questions before a presentation. The skill you practiced today transfers directly to all of it.

Optional Knowledge Check

If you would like to test what you remember, a short Knowledge Check is available on the left side of your screen.

Nothing is recorded. No score is stored. No pressure at all.

It is there if you want it.

You Are Done

You can now open NotebookLM, add a source, and generate a Video Overview without help.

The next step: open a new notebook this week with something from your actual work. See what it produces. That is where this gets interesting.
